

DETERMINANT SYSTEMS

The AI Platform for the Governed Enterprise

Search everything your organization knows. Map it into a living knowledge graph.
Put AI agents to work across every channel. Turn ideas into deployed applications
— all on one platform, with the governance and auditability regulated
enterprises actually require.

■ EXECUTIVE SUMMARY

One Platform. Four Ways to Put Your Enterprise to Work.

Every organization is sitting on the same untapped asset: everything it already knows — documents, contracts, conversations, records, and institutional expertise scattered across dozens of systems. LACE turns that scattered knowledge into a governed, searchable, AI-ready foundation, and then puts it to work through agents and applications your teams can build in hours, not quarters.

LACE DELIVERS FOUR INTEGRATED OFFERINGS ON A SINGLE GOVERNED FOUNDATION

Enterprise Search

One search bar across every system your organization uses — SharePoint, Google Drive, Slack, email, file shares, cloud storage, databases, and existing indexes. Permissions-aware, source-cited answers to plain-language questions.

Knowledge Graph

Your documents and data, transformed into a living map of the people, organizations, contracts, obligations, and relationships that run your business — where every fact carries a receipt back to its source, and you can ask what you knew at any point in time.

Agentic Platform

Build AI agents with AI assistance and deploy them wherever work happens — web chat, Slack, Teams, email, SMS, and voice — grounded in your data and governed by your policies.

App Builder

Describe an application in one prompt and watch it go live at a real URL in minutes — complete with a user interface, database, sign-in, and the option to charge for access. No engineering team required.

THE LACE PRINCIPLE

LACE treats AI the way a regulated enterprise treats any high-stakes process: with total accountability. Every answer cites its sources. Every fact traces to its evidence. Every agent action is budgeted, approved, and auditable. The intelligence is powerful — and it operates inside your rules.

■ THE PROBLEM

Your Organization Knows More Than Any of Your Systems Can Tell You.

AI is transformative in theory and unacceptable in practice for most high-stakes work. The reasons are structural — and they are exactly what LACE was built to solve.

Knowledge is trapped in silos

The answer to almost any business question already exists somewhere in your organization — in a contract on SharePoint, a thread in Slack, a spreadsheet in a shared drive, a record in a database. But no one can see across all of it at once. Employees spend hours hunting for information a colleague already found last quarter, and decisions get made without the facts the organization already owns.

Generic AI can't be trusted with real work

General-purpose chatbots don't know your business, can't see your data, invent answers when they don't know, and offer no way to verify what they say. That's fine for brainstorming. It is unacceptable for a healthcare proposal, a legal filing, a financial report, or a defense intelligence product. Regulated organizations don't need AI that is usually right — they need AI they can verify, audit, and defend.

Custom AI projects are expensive, slow, narrow

Building a single AI-powered application from scratch typically costs \$200K-\$500K and takes months. The result serves one use case with no reusable foundation — every subsequent project starts from zero. Most of the workflows that would benefit from AI can never justify that investment.

WHY NOTHING ON THE MARKET SOLVED THIS

Enterprises need four things at once: the ability to find everything they know, to understand how it connects, to act on it through governed AI agents, and to ship it as real software — without betting the compliance program on a black box. No single platform delivered all four. That is the gap LACE fills.

■ THE PLATFORM

Four Offerings, One Governed Foundation.

Each LACE offering is valuable on its own. Together, they compound: Search feeds the Knowledge Graph, the Graph grounds your Agents, and Agents power the Applications you build — all sharing one security model, one audit trail, and one deployment footprint.

OFFERING	WHAT IT DOES	WHO USES IT	THE MOMENT IT CLICKS
Enterprise Search	Connects and indexes every knowledge source; answers plain-language questions with cited sources.	Everyone — from analysts to executives.	"I asked one question and got the answer with the exact paragraph it came from."
Knowledge Graph	Extracts the entities, relationships, and facts inside your documents into an explorable, auditable map.	Analysts, compliance, legal, intelligence teams.	"Show me everything we know about this supplier — and what changed since March."
Agentic Platform	Design, test, and deploy AI agents with tools and skills, across chat, email, messaging, and voice.	Operations, service, and program teams.	"Our intake agent answers on Slack, email, and the phone — and every action is logged."
App Builder	Turns one prompt into a live, full-scale application — UI, database, sign-in, hosting, and monetization.	Domain experts, product owners, developers.	"I described the tool at 9:00. My team was using it before lunch."

■ THE GOVERNED FOUNDATION BENEATH ALL FOUR

Everything on LACE runs through a common control plane: role- and policy-based access enforced at the moment of every query, budget and spending limits on AI usage, human approval gates on sensitive actions, and a complete audit trail from every answer back to the data, reasoning, and policies that produced it. Deploy in our cloud, your private cloud, on-premises, or fully air-gapped environments with no external AI calls.

CONTROL PLANE · HUMAN REVIEW · BUDGET CAPS · ALLOWED PIPELINES · ON-PREM · AIR-GAPPED

■ OFFERING 1 OF 4

Enterprise Search

"One search bar for everything your organization knows."

LACE connects to the systems where your knowledge already lives — document repositories, messaging platforms, email, cloud storage, databases, and existing search indexes — and unifies them into one consolidated, continuously synchronized view of the enterprise. Ask a question in plain language; get an answer grounded in your actual documents, with citations that click through to the exact source passage.

Connect everything

Out-of-the-box connectors for SharePoint, Google Drive, OneDrive, Dropbox, Notion, Slack, email, Amazon S3 and cloud storage, databases and spreadsheets, websites, and existing enterprise indexes — with scheduled sync that keeps the picture current automatically.

Answers, not links

LACE doesn't just return a list of files. It retrieves the most relevant passages, understands meaning as well as keywords, and composes a direct answer — with every claim cited back to its source.

Permissions-aware by design

Access rules are enforced at the moment of every search. No one is ever shown a result they wouldn't be authorized to open in the source system — the non-negotiable requirement for rolling search out to the whole company.

Search without moving data

Federated discovery lets separate divisions, enclaves, or partner environments find what exists elsewhere without copying sensitive data across boundaries — built for organizations where data residency and compartmentalization are hard requirements.

The fuel for everything else

The same unified index powers grounded AI chat, the Knowledge Graph, your agents, and the applications you build — so every AI feature on the platform answers from verified enterprise data, not guesswork.

IN PRACTICE

A program manager asks: "What did we commit to in the Meridian contract, and has anyone flagged risks against it?" LACE pulls the signed contract from SharePoint, the risk thread from Slack, and the status memo from the shared drive — and answers in one place, with all three sources cited. Time to answer: seconds, not an afternoon.

■ OFFERING 2 OF 4

Knowledge Graph

"Don't trust the graph. Audit it — live."

Search finds documents. The Knowledge Graph understands what's inside them. LACE reads your document collections and extracts the entities that matter — people, organizations, contracts, projects, locations, obligations — along with the relationships between them, into an interactive, explorable map of your enterprise. It is built to a standard most graph products never attempt: every fact on the map carries a receipt.

Automatic extraction, human control

AI proposes what it finds; your reviewers approve what enters the graph. Extraction quality is measured against scorecards, and the platform refuses to publish results that don't meet the bar.

Every fact has a receipt

Click any entity, relationship, or value and see the highlighted sentence in the original document it came from, who approved it, and when. The graph isn't an AI's opinion — it's an auditable index of your evidence.

A complete picture of every entity

Duplicate records are recognized and merged, so "Acme Corp," "ACME Inc." and "Acme Corporation" become one entity — with every document, relationship, and fact about it in one 360° view.

Travel through time

The graph remembers not just what is true, but when it was true and when you learned it. Scrub back to any date and see the world as it was — or as you believed it to be.

Contradictions surface themselves

When two sources disagree — an amount, a date, an obligation — LACE flags the conflict and shows both pieces of evidence side by side, so discrepancies are found by the platform, not by auditors a year later.

Built for federal standards

LACE's extraction is grounded in the formal ontology standards (BFO/CCO) adopted as the baseline for DoD and Intelligence Community data programs — exportable as a compliance artifact for accreditation.

IN PRACTICE

Drop two versions of a policy or contract into LACE and get an instant conflict map: every changed obligation, amount, and date — each with both source passages side by side. Then scrub the timeline back and watch your enterprise evolve.

■ OFFERING 3 OF 4

Agentic Platform

"AI teammates that follow company policy."

Agents are AI workers that don't just answer questions — they take action: researching, drafting, processing requests, coordinating handoffs, and operating tools. LACE lets your teams build agents with AI assistance — describe the role, and the platform helps design the agent, its tools, and its skills — then deploy them across every medium your organization works in.

Build with AI assistance

Guided studios for agents, tools, and skills: describe what you need in plain language and iterate on a live, working preview. Test conversations side-by-side before anything goes near production.

Deploy across every channel

One agent, many surfaces: embedded web chat, Slack, Microsoft Teams, email, SMS and WhatsApp, and live voice over the phone — plus a clean handoff to human staff, with full context, whenever a conversation needs one.

Grounded in your knowledge

Agents draw on Enterprise Search and the Knowledge Graph, so their answers come from verified organizational data with citations — not a model's imagination. External AI tools can be granted the same governed, permission-filtered access through open standards.

Governed, not just capable

Every agent operates within budget caps, usage limits, and approval gates. Sensitive actions route to human sign-off. When an agent proposes a change to enterprise data without adequate evidence, the platform rejects it — with the reason on record.

Watch them think

Step-by-step execution traces show exactly what an agent did, which tools it used, what it retrieved, and why — turning "trust the AI" into "inspect the AI."

Prove them before you promote them

Built-in evaluation suites score agents against test scenarios before deployment, and platform monitoring watches cost, quality, and behavior in production.

IN PRACTICE

A contracts intake agent receives a vendor question by email, checks the governing agreement through Enterprise Search, drafts a response citing the exact clause, and routes it to counsel for one-click approval — with the entire chain of evidence and reasoning preserved in the audit trail.

■ OFFERING 4 OF 4

App Builder

"From one prompt to a live application — in minutes."

Most great software ideas die in the backlog: the team that needs the tool can't build it, and the engineering organization can't prioritize it. LACE App Builder removes the bottleneck. Describe the application you want — an inventory tracker, a client portal, a review workflow, an entire product — and LACE designs, builds, and deploys it as real, running software at a real web address.

One prompt to production

Describe the app; an AI builder plans it, constructs it in a safe sandbox, shows you a live preview, and publishes it to a public URL — complete with hosting, a database, and user sign-in. No code, no cloud accounts, no git.

Real applications, not demos

Every app ships with professional infrastructure by default: secure authentication, user and role management, structured data storage with an automatic admin panel, and the deployment rigor of an enterprise engineering team — versioned releases, gradual rollouts, and one-click rollback.

Monetize from day one

Built-in subscription and billing infrastructure means an internal tool can become a revenue-generating product without a re-platforming project. Launch, price, and sell on the same platform.

Every app can talk

Applications ship with a built-in AI assistant wired to the app's own data and tools — so every product you launch is an AI product, with zero extra work.

Remix and reuse

See an app you like? Remix it into your own editable copy in seconds. Templates and prior builds compound, so your hundredth app is dramatically faster than your first.

A professional lane for developers

Engineering teams get a full toolkit — local development that mirrors production, AI coding agents, automated verification, and push-to-deploy with infrastructure fully automated. Non-technical builders and developers publish through the same governed pipeline.

IN PRACTICE

"I described an inventory tracker in the Studio. Fifteen minutes later I opened a live URL, added our first records, and sent the link to my team." That is the acceptance bar the App Builder is engineered — and tested — against.

■ THE FOUNDATION

Governance Is Not a Feature. It's the Architecture.

Everything LACE does — every search, every extracted fact, every agent action, every deployed app — runs on one accountability substrate. This is what separates a platform regulated enterprises can adopt from a demo they can't.

Provenance on everything

Any claim in any output can be traced back through the reasoning that produced it, the sources that informed it, and the policies that governed it — down to the highlighted sentence in the original document.

Access control at the moment of use

Permissions are checked when a question is asked, not when data was indexed — across search results, graph entities, agent answers, and app data alike. Role-, attribute-, and classification-aware.

Policy-enforced AI

Budget caps, usage limits, allowed-action lists, and approval gates wrap every AI operation. The control plane can observe, recommend, or automatically intervene when a process deviates.

Quality gates that say no

AI output is validated against defined standards before it lands anywhere that matters. Work that doesn't meet the bar is rejected or routed for remediation — automatically, with the reasons on record.

Deploy on your terms

Managed cloud, private cloud (VPC), on-premises, or fully air-gapped with no external AI calls. Built by a team with a production DoD/USAF delivery pedigree and designed for accreditation evidence — lineage, access enforcement, and standards conformance, exportable as artifacts.

■ WHO IT'S FOR

Built for Organizations Where "Trust Me" Isn't an Answer.

LACE is a horizontal platform with a deliberate center of gravity: federal, defense, and regulated commercial markets — the buyers for whom auditability is the purchasing decision.

MARKET	WHAT THEY RUN ON LACE
Federal & Defense	Intelligence analysis over document corpora, standards-conformant knowledge engineering (BFO/CCO), RFP and compliance package generation, cross-enclave discovery without data movement, air-gapped deployment.
Legal & Compliance	Contract intelligence and obligation tracking, conflict detection across document versions, point-in-time "what did we know and when" queries for investigations and litigation holds.
Financial Services	Grounded research and reporting where every figure traces to verified data; auditable analysis workflows; agents with hard policy constraints.
Healthcare & Life Sciences	Governed document intelligence across regulatory frameworks, submission preparation, and traceable AI assistance in high-stakes documentation.
Operations & Shared Services	Enterprise-wide answers desk, intake and service agents across email/chat/voice, and rapid internal tooling through the App Builder — at near-zero marginal cost per new application.

■ HOW LACE GENERATES REVENUE

1. Platform subscriptions	Organizations license LACE as their governed AI foundation — search, knowledge graph, agents, and app building on one contract, priced by deployment scope and usage.
2. Apps as products	Applications built on the App Builder — by us and by our customers — are hosted, billed, and monetized through the platform, creating a portfolio of SaaS products on shared infrastructure at near-zero marginal launch cost.
3. Enterprise services	High-touch implementations for bespoke workflows, on-premises and air-gapped deployments, and integration into existing enterprise systems — consulting-grade delivery, dramatically accelerated by the platform.

■ COMPETITIVE POSITION

The Market Converged on Our Architecture. It Didn't Catch Our Standard.

The 2026 enterprise AI landscape validated LACE's founding thesis: AI needs a governed, structured view of enterprise knowledge, not just a bigger model. Enterprise search vendors, graph databases, and data platforms are all racing toward that position — each from a partial starting point.

THEY OFFER	WHAT'S MISSING	THE LACE DIFFERENCE
Enterprise search platforms (Glean and peers)	Strong permissions-aware search — but shallow document understanding, no formal knowledge model, no application layer.	LACE pairs unified search with a deep, evidence-locked knowledge graph and turns insight into deployed software.
Data & ontology platforms (Palantir and peers)	Powerful but heavyweight: consultant-led onboarding, proprietary data models that don't conform to mandated federal ontology standards.	LACE is standards-conformant (BFO/CCO — the adopted DoD/IC baseline), self-serve, and provable: every fact carries its evidence.
Graph databases (Neo4j and peers)	Excellent storage engines — but they are infrastructure: no extraction, no governance, no review workflow, no business surface.	LACE is the finished product: extraction, review, quality gates, time travel, visualization, and agent access in one platform.
Agent & no-code builders	Fast demos, weak accountability: no grounding in governed enterprise data, no audit trail, no path to production-grade software.	LACE agents and apps inherit the full governance substrate — citations, budgets, approvals, and audit — automatically.

■ THE MOAT

The provable knowledge graph

LACE occupies a category position no incumbent holds: a knowledge platform whose every assertion is evidence-locked, time-aware, and independently verifiable — with conformance to the ontology standards federal buyers are mandated to use, which proprietary platforms cannot claim without re-architecting.

Compounding reusability

Every schema, agent skill, connector, and app template built on LACE makes the next one cheaper. The hundredth deployment inherits everything before it; a new entrant starts from zero.

Depth of architecture

LACE is not a wrapper on a model API. It is a deep orchestration system — governed execution, validated outputs, single controlled mutation point, full lineage — developed through years of iteration across commercial and defense contexts.

■ WHY NOW

Three Forces Converged.

AI models crossed the capability threshold

Modern models handle complex reasoning, structured output, and tool use — but only deliver enterprise value when orchestrated with structure, grounding, and guardrails. The raw capability arrived; the governance layer is the scarce asset.

Enterprises want AI but cannot adopt black boxes

Every major organization is under pressure to deploy AI, and regulated industries — defense, government, finance, healthcare, legal — cannot deploy what they cannot audit. Analyst consensus now rates structured knowledge as a critical enabler for enterprise AI, and the knowledge graph market is projected to grow several-fold over the next five years.

The cost of software collapsed — for whoever owns the platform

When one prompt produces a deployed application, the long tail of underserved workflows becomes economically viable. The winners will be the platforms that make that speed safe enough for real organizations to use.

■ THE BOTTOM LINE

Most AI platforms help you run a model. LACE helps you run the enterprise.

Find everything you know. Understand how it connects. Put agents to work on it. Ship it as software. One platform, one audit trail, four ways to compound the value of what your organization already knows — with the accountability that regulated enterprises actually require.
